# Nam June Paik: Becoming Robot

**A**s technology becomes a part of everyday life, it begins to play an integral part of our lives. Technology begins to influence, or at least, affect how we think and function, this happens in art as well. Nam June Paik, a groundbreaking performance artist has a place in history, and a legacy the contemporary art world should not forget, or be overlooked.

Currently featured at the Asia Society Museum, is the

thematic exhibit *Becoming Robot*, which showcases Nam June Paik's experimentation with the robotic theme (humanoid sculptures created from various hardware parts, as well as ready-made of collected toy robots) and video art installations. Through this exhibit, we find that Nam June Paik approached art scientifically, with his own thesis on how technology relates to us in our lives. Paik was an artist of the Avant-garde; he did not fear technology, and foresaw how much of

an importance it was going to be in society, so he chose to use it as a reoccurring theme in his work.

If Modernism in the late 20th century exploited convenience, and the application of technology, then the Avant-garde twisted things around, and expanded on how we use technology, and how it could relate to us each individually, on a personal level. *Becoming Robot* is not Post-Modern simply because it is fundamentalist or that specific thrilling moment when technology is introduced. There was no rebellion in Paik's work, he was simply communicating his love for these new and exciting ways to make conceptual art, and by consciously taking advantage of these new platforms, he was (in result) being experimental.

Nam June Paik's concept was technology for what it is exactly, and not being overly-confident in it, as he knew it was something that would evolve. Paik accepted the imperfections that came along with working with computers, wires, building frames for robots out of collected junk piles, as his approach was like working in a laboratory: getting the most out of whatever was available, while pushing everything a little further each time.

Upon entering the exhibit, the first thing that will get anyone's attention, is the clunky mechanical robotic sculpture (looking something like a skeletal prototype to the character

"Johnny-5" from the movie *Short Circuit*) "Robot K-456" was originally built in 1964. The "robot" is scaled to, and has a humanoid form made from seemingly, anything. Paik was able to get his hands on and make sense out of. Everyday items ranging from what appeared to be women's shoulder pads, to hand gloves, to loud speakers, wires and electric fans, etc. Opposite from the robot figure is a recorded, televised news broadcast from CBS (NY.) back in 1989; featuring the same robot, but this time, Paik had programed it to move on its own, and roam the streets of Manhattan, during business hours! A news reporter interviews Paik while K-456 moves toward a crowd of spectators. Suddenly, a speeding car crashes into the robot from behind while attempting to make a right turn. After a few yells and screams, everyone frantically run to the robot's rescue while it's face down on the ground, in the middle of the street. Early in the exhibit, we learn Nam June Paik accepts technology with all of its flaws, in which he had a sense of humor about it. Paik was more fascinated with the way things worked at the seams.

There are original video art installations, which make up a good sum of *Becoming Robot*. From here we get to see how Paik had been dubbed "the founder of video art." Through experimentation in video collage, live action mixed with animated graphics, and often times a mix-down of audio as a soundtrack; Paik was able

to communicate themes and human emotions in a way that may have been groundbreaking at the time, but in today's world, this kind of media art is not difficult to find if you look around long enough, but with that said, we can trace this style of Avant-Garde all the way back to Paik's era.

For myself personally, many of these videos (judging by the time they were composed) are about the wonder and mystery of technology and being sucked into the concept. Paik captures emotions with the use of computer graphics and film, rather than with paint on a canvas.

*Performance art which was quite similar to what was happening in the industrial music scene in the UK, with bands like Cabaret Voltaire, and Psychic TV who were also experimenting with video.*

Larger scaled robots, similar to "Robot K-456" but now, made out of whole television sets, projecting video graphics which become more advanced as we move forward into the exhibit. Displayed computer graphics shows age, (as depicted by it's year in description: 1986,) but are not spoiled by the overall concept Paik has created. How these videos were produced, is a result of a collaborative effort between a studio and the artist; a non-profit organization and collaboration between artists and engineers known as E.A.T. (short for "Experiments in Art and Technology.") The program worked directly with both the artist and the engineer which would result in an advanced collaboration between the two parties.

The most interesting aspect about Nam June Paik's career is his range of talent and interests, which led to many more collaborations. Along with technology, music was another force which played a huge factor in his portfolio. Having worked with many musicians and other multi-media artists such as John Cage, Philip Glass, Yoko Ono, and Joseph Beuys, who are all featured in, almost making cameo-like guest appearances somewhere or other in this exhibit.

From Paik's travels between Germany and New York

City: these collaborations often resulted in performance art which is quite similar to what was happening in the industrial music scene in the UK, with bands like Cabaret Voltaire, and Psychic TV (who were also experimenting with video.) One thing that is certainly in common was the influence from Beuys, so it would not be so much of a coincidence that any video footage found from this era is in a similar context, since Paik had worked with Beuys firsthand.

Charlotte Moorman was another collaborator, who became a focal part of the Avant-garde group Nam June Paik was involved in. Moorman, a cellist who was often used as a subject in Paik's work, actually had her own shrine within the exhibit in her memory; a series of collected documents and photographs were exhibited on the musician and her career. She can be seen playing the cello while there is a small television screens placed on her garment, covering her chest in "TV Bra for Living Sculpture."

There was an incident where Moorman was nude, (or partially nude) while performing with Paik, who are later on, arrested for indecent exposure. It was the antics of the Moorman/ Paik duo which made them notorious, particularly Moorman who became dubbed as "the topless

cellist," during her involvement with Paik. I found *Becoming Robot* to be a very memorable, and an extremely educational exhibit. The fact that music and art is so well intertwined, along with the subject of technology and futurism, is what makes this exhibit, and this artist special. Anyone who wishes to study, or use computers as a tool for art, whether it be animation of still graphics should be aware of this artist. ■

Sea Orbiter

## Our Goal

Among the many scientific goals the project will enable, the SeaOrbiter will also directly enhance the understanding of the ocean's role in global climate and biodiversity. It will provide a number of people to survive in an environment not considered to our planet. It will be a great first step in the upper reaches of the ship above sea level. It is not simply just a submarine.

## The Mission

Among the many scientific goals the project will enable, the SeaOrbiter will also directly enhance the understanding of the ocean's role in global climate and biodiversity. It will provide a number of people to survive in an environment not considered to our planet. It will be a great first step in the upper reaches of the ship above sea level. It is not simply just a submarine.

## About SeaOrbiter

First conceived in 1973, the SeaOrbiter project is a developing mission set to explore the sea (above water, and underwater) for ecological, resource, and further scientific research on our oceans. A better understanding of our environment, and planet started with the natural curiosity for uncharted terrain. By descending into our seas as a fully functioning, multi-tasking laboratory, information about nature, and our ecology can be collected and used in resourceful ways in which can benefit not only sea life, and the preservation of it, but also the human race.

# SEAORBITER

Starship Enterprise of the ocean

A series lecture hosted by

**Bill Todd**

presented at

**explor.cean**  
 NEWPORT HARBOR NAUTICAL MUSEUM

**Hello & welcome**  
 to our first annual gala event for

Founder of the SeaOrbiter project. As a visionary architect, and passionate about the sea, Jacques Rougerie has, for more than 30 years, based his research and the structures he has built on biologic architecture inspired mainly by marine biological forms and a concern for sustainable development, drawing attention to the beauty and fragility of the sea and its fundamental role in the great story of humanity.

Throughout his career, Rougerie has built underwater habitats, laboratories, marine research centers, vessels, with sea-through hulls, sub-aquatic museums, and had designed underwater villages and dwellings, especially combining the two positions of the sea and architecture. Like a true underwater explorer, he tests his own creations and has even lived several times underwater (in sub-sea habitats), famously participating in the world record achievement of 71 days under the sea in the United States.

**Jacques Rougerie**

Program Manager for Exploration Analog at NASA's Johnson Space Center in Houston Texas. Formerly served as NASA's Undersea Research Team Project Lead, and Spaceflight Training Simulation Supervisor at NASA-JSC, currently working for Universities Space Research Association (USRA) as the MEMO and SEATED Project Manager.

He has worked in several underwater habitats, plotted many submersibles, and has conducted myriad expeditions on the parallels between living and working in outer space and "inner space".

REMO (co-founded by Todd) is a program which will allow for future laboratory as a research facility for space missions which involve long term space habitation. Along with Jacques Rougerie, Todd has spent many years helping to develop the future undersea exploration vessel SeaOrbiter.

**Bill Todd**

**Max Farn**

Scientist and Executive Director. An engineer in environment, a PhD in Marine Sciences and oceanography, and a professional diver for many years, Axel Farn has coordinated a great number of underwater expeditions around the world, notably around the Antarctic. During this period he got several Jacques-Yves Cousteau and the Calypso expeditions to visit numerous occasions. Then as a scientific journalist he has followed the main expeditions of modern oceanography relating the latest discoveries in the fields of marine sciences, marine conservation and marine environment policy, with particular emphasis on the conservation of the whales.

As an international consultant in conservation and marine resources he has joined the SeaOrbiter project to which he has dedicated his ability to convey science, education and communication, as well as international networking in order to help SeaOrbiter better address its challenges in offering in-depth and a step forward in the development of ocean exploration.

Managing Director for SeaOrbiter, Patricia Libbrecht has been a science journalist in the Calypso Project in Antarctica / Siboga and then as a MSc in the field of marine biology. Following extensive travel and research, she joined the Marine Sciences as CEO and reorganized the company with the successful launch of the product: Planifiter.

As with a similar career from managing a series of business product and businesses, founding the United Libbrecht became rapidly an advisor for startups bringing them his experience in strategy and development. Patricia Libbrecht joined SeaOrbiter earlier to move the project into an industrial phase, making the first vessel after finalizing the fundraising.

Steve Jobs: News Article Cover

# AN APPLE A DAY

Without the leadership of Steve Jobs, does Apple have what it takes to stay on top of systems questions?

STEVE JOBS is a tall, lithe, bearded man with a ponytail, wearing a dark suit and tie. He is standing behind three vintage Apple II computers with blue screens. The computers are arranged in a row, and Jobs is leaning over them, looking at the screens. The background is a plain, light-colored wall.

Jobs is the founder and CEO of Apple Inc. He is a visionary leader who has transformed the way we think about technology. He is a man of many talents, including a love for design, a passion for innovation, and a deep understanding of the needs of his customers. He is a man who has built a company that is not only successful but also a force for good in the world.

Neville Brody: Typography Book

NEVILLE BRODY

Neville Brody is perhaps the best known graphic designer of his generation. He studied graphic design at the London College of Printing and first made his name as the publisher of the underground magazine *Fluxus* and his involvement in the British independent music scene in the early 1970s. It was his work on magazines that finally established his reputation as one of the world's leading graphic designers. (Fluxus)

NEVILLE BRODY

Brody created typographic systems as integrated, holistic systems with decorative details, such as geometric patterns, textures, and colors. In 1980 he founded the studio at the (now) University of Westminster.

Brody created typographic systems as integrated, holistic systems with decorative details, such as geometric patterns, textures, and colors. In 1980 he founded the studio at the (now) University of Westminster.

Born in London, Brody studied at the University of Westminster and then at the London College of Printing (LCP) where he met his friend, Peter Saville. Brody was very involved in the LCP's music scene and later, he designed some of the most iconic posters for the band The Smiths, including 'The Smiths' and 'The Smiths'.

Brody created typographic systems as integrated, holistic systems with decorative details, such as geometric patterns, textures, and colors. In 1980 he founded the studio at the (now) University of Westminster.
